

VPN — Verified Peptides Network

Cloudflare Security Setup Guide

Created by Said Kolenovic · Born in Noor Labs · May 20, 2026

Why Protect Your Site?

Your VPN site currently runs on GitHub Pages with a PIN screen. This guide adds three layers of professional-grade protection — all free:

1. Private GitHub repo — source code hidden from public
 2. Cloudflare Access — email gate before anyone sees your site
 3. PIN screen — already built into your site
-

Step 1 — Make Your GitHub Repo Private

- Go to your repo on GitHub.com
 - Click Settings → scroll to the bottom → Danger Zone
 - Click "Change repository visibility" → Make private
 - Type your repo name to confirm → click the button
 - Your site stays live. Your source code is now hidden.
-

Step 2 — Sign Up for Cloudflare (Free)

- Go to cloudflare.com → Sign Up → choose the Free plan
 - Click "Add a site" → enter your domain name
 - Cloudflare scans your existing DNS records → click Continue
 - Select Free plan → Continue
 - Cloudflare gives you 2 nameservers — copy both
-

Step 3 — Point Your Domain to Cloudflare

- Go to where you bought your domain (Namecheap, GoDaddy, etc.)
 - Find the Nameservers / DNS settings for your domain
 - Delete the existing nameservers
 - Paste in the 2 Cloudflare nameservers
 - Save — takes up to 24hrs but usually under 1 hour
 - Cloudflare will email you when it is active
-

Step 4 — Connect GitHub to Cloudflare Pages

- In Cloudflare dashboard → Pages → Create a project
 - Click "Connect to Git" → authorize GitHub → select your repo
 - Framework preset: None
 - Build command: leave blank
 - Build output directory: leave blank (or type /)
 - Click Save and Deploy
 - Cloudflare builds your site and gives you a *.pages.dev URL
 - Connect your custom domain: Pages → your project → Custom domains → Add
- Every push to GitHub auto-deploys. Same workflow as before. Cloudflare Pages is faster than GitHub Pages.
-

Step 5 — Add Access Protection (The Real Lock)

- In Cloudflare dashboard → click Zero Trust (left sidebar)
 - Sign up — free for up to 50 users
 - Go to Access → Applications → Add an application
 - Choose "Self-hosted"
 - Application name: VPN Site
 - Application domain: your domain (e.g. vpndata.com)
 - Click Next
 - Policy name: VPN Members | Action: Allow
 - Include rule: Emails → add your members' email addresses
 - OR use One-time PIN — approved emails get a code sent to them
 - Click Save
- Visitors now see: Cloudflare login → enter email → get a code → enter code → then your PIN screen.
-

What You End Up With

Layer	What It Does	Cost
Private GitHub Repo	Source code hidden from public	Free
Cloudflare Pages	Fast hosting, auto-deploy from GitHub	Free
Cloudflare Access	Email gate — only approved members	Free
PIN Screen	Already built into your site	Free

Pro Tips

- ✓ Change your PIN every few months — share only in the VPN group
- ✓ Add or remove member emails in Cloudflare Access anytime

- ✓ Cloudflare includes free DDoS protection and SSL — zero setup
- ✓ Push to GitHub → Cloudflare auto-deploys. No extra steps.
- ✓ Cloudflare Pages is faster than GitHub Pages — global CDN included
